Total Net Sales by Scenario

Revenue Recovered by Scenario

Revenue Recovered by Category (10% Cap)

What-If Discount Scenario: Key Takeaways

Capping Fashion discounts at 10% recovers ₹1,624. Extending the cap to all categories recovers **₹1,858.80** total.

Top 3 Orders Driving Fashion Recovery

Order	Product	Current Disc	Recovered
O1030	Running Shoes	25%	+₹899.70
O1006	Running Shoes	20%	+₹299.90
O1015	Cotton T-Shirt	20%	+₹199.60

These 3 orders account for **₹1,399.20 — 86%** of the Fashion recovery.

Fashion Order-Level Impact (10% Cap)

ORDER_ID	PRODUCT	CURRENT_DISC_PCT	GMV	CURRENT_NET	CAPPED_NET	REVENUE_RECOVERED
O1030	Running Shoes	25.00	5998	4498.50	5398.20	899.70
O1006	Running Shoes	20.00	2999	2399.20	2699.10	299.90
O1015	Cotton T-Shirt	20.00	1996	1596.80	1796.40	199.60
O1024	Running Shoes	15.00	2999	2549.15	2699.10	149.95

O1022	2026-09-11	South	Electronics	USB-C Hub	0	2499	0.20

Key Findings & Recommendations

Three Evidence-Based Findings

1. **Electronics and Fashion are nearly tied on net sales (₹28,141 vs ₹28,103), but for different reasons.** Electronics wins on volume and low discounting (4.9%); Fashion wins on per-order value (AOV ₹2,162) driven by premium products. Home trails at ₹19,302.
2. **Discounts correlate with higher order values (r=0.321) but not with quantities (r=0.028).** The strategy is pricing-tier-based — higher-priced items get larger discounts — not volume-incentive-based.
3. **10% combined cancellation-and-return rate is concentrated in high-value/discounted orders.** All 4 cancelled/returned orders involved premium products or discounted items. South is the only region with both a cancellation and a return.

Two Practical Recommendations

1. **Re-evaluate discounting on premium Fashion products.** Running Shoes carries the highest discount rate (13.3%) yet still had a cancellation. An A/B test reducing discounts by 50% would reveal if the discount drives conversions or erodes margin.
2. **Investigate South region's fulfilment process.** South has the highest discount rate (11.9%), both a cancellation and a return, and a zero-quantity return (O1022) suggesting a possible data-entry or fulfilment error.

One Limitation

The dataset has only **40 orders over 11 days** — all findings are small-sample hypotheses. The 5% cancellation rate is based on just 2 orders; one different outcome would shift it to 2.5% or 7.5%.

One Follow-Up Question

Does the discount–order-value relationship persist at scale, and does it translate to higher net revenue per order, or does the discount cost outweigh the revenue lift?
